SplunkLab **1**

The first thing I did to start this **SplunkLab** assignment was put in my NECC school email address and created a strong password etc. I then entered the welcome page. At the welcome page I clicked on the tab at the bottom of the screen named **"Search beginner learning path".** Then I chose the **"All Search Expert Knowledge Manager training"** curriculum.

The eight **(8)** labs I completed in **Splunk** along with their screenshots of completion are written below with the date I had completed each lab assignment.

The first lab I did in **Splunk** was....

1. **Introduction to Splunk (elearning).**

I found this first intro to splunk interesting, learning more about splunk its interface, tools, and environment. This lab was **completed on April 1st, 2026.**

2. **Using Fields** was my second lab in **Splunk.** This lab proved to be quite a challenge for me, personally for the first time doing something like this.

Learned more about fields, what events were, host, source, and sourcetype. Learned about **(a) string values** and **(#) field value.** Filtering fields was interesting. Saw stuff about Regular Expressions with search results. **Regex, Erex (easier) creates regular expressions for you, Rex (harder).**

This second lab was quite extensive. This lab took a lot of understanding reading documentation and rewriting commands, also a lot of trial and error to ensure commands worked properly. This lab was **completed on April 2nd, 2026.**

3. **Search Optimization** was the third lab I completed in **Splunk** on **April 2nd, 2026.**

This was a little easier than the previous lab as I was not familiar with reading the splunk documentation until this assignment. I got used to their style of documentation with this lab. There were commands I had to try a couple times and try to rewrite them and eventually get them running properly. This lab was challenging as well but not as difficult as the previous lab for me.

4.

The fourth lab I did in **Splunk** was **Scheduling Reports and Alerts (eLearning).** I found this lab interesting, and wasn't too challenging to navigate based on the documentation. It was interesting to see a lot of the technical side of things, how scheduling works and reporting something, adding a specific alert time frame and disabling the alert. What I found most interesting was setting the alert priority to either high, medium or low etc.

This fourth lab was completed on April 3rd, 2026.

5. The fifth lab I did in **Splunk** was **Visualizations (eLearning).**

This Splunk assignment was interesting. I would say I am a visual learner, and hands on as well. Seeing the different data being created into different visualizations was cool. I did some work like this in **Data Management.** I liked how you can mess around with the visualizations and make different charts and maps for the lab.

This fifth lab was completed on 4/3/26.

6. The sixth lab I did in **Splunk** was **Working with Time.**

This lab was a little confusing as the commands writing them were a little weird sometimes or pasting them in. Some results worked the first time or after a few tries. This lab was one of the more challenging ones for me personally but I did the best I could, the quiz was hard as well but I got a high enough score to pass, the bare minimum score which is 75%.

This sixth lab was completed on April 3rd, 2026.

7. The seventh lab I did in **Splunk** was **Statistical Processing. This lab was completed on April 5th, 2026.**

I found the different charts interesting. Saw this in the visualizations assignment and worked with other charts that were more for statistical data, like numbers. Learned new commands based on the documentation for the assignment like the stats command or the chart command. Learned about the different concatenations with statistical data charts and data.

Overall the lab itself was somewhat challenging following the documentation, each lab I have had to rewrite or repaste commands from the documentation and see if they work as sometimes writing it or pasting the commands from the documentation I write something wrong and have to write it again due to incorrect spacing positions or incorrect spelling. I liked how it handled different data and that you can add custom names to the different charts like line charts. Custom names mentioned in the assignment examples were “Day” and “Volume” etc.

8. **The final** lab I did in **Splunk** was **Comparing Values.** This lab was completed on **April 5th ,2026.**

This final lab was the easiest for me as I had gotten used to their documentation on the site. With this lab I had to break the commands apart and write them little by little as the commands for this lab were broken up on the page, for me at least. The quiz overall wasn't too bad either. Overall each lab had different challenges for me but this one was the most straightforward for me personally.

Splunk was an interesting site and I might do some of their other training and labs someday.
