SplunkLab II

The goal of this splunk assignment II is to try an additional five **(5)** labs in the Search Expert and Knowledge Manager curriculum. This assignment was difficult, it took me a couple more tries than the previous Splunk assignment to complete the labs and quizzes. Below I added screenshots of the **5** extra certificates I had obtained in the Splunk Search Expert and Knowledge Manager curriculum, along with what I learned and what I found challenging.

The five **(5)** different extra Splunk Search Expert and Knowledge Manager labs I completed were in the order that follows below:

Additional Lab 1:

Result Modification.

This lab was the first of five additional labs in the splunk curriculum. The lab documentation was straightforward and I was used to following along with the site instructions now, it was a matter of writing the commands properly or getting them to work. Overall since I knew what I was doing, with knowledge from other labs this first additional lab was not too bad. I feel like for each lab there are always a few commands you have to either paste or rewrite again which at times can be frustrating.

This first additional lab assignment was completed on **April 6th, 2026.**

Additional Lab 2:

Leveraging Lookups and Subsearches.

My second additional lab was **Leveraging Lookups and Subsearches**. This one took me a while. The documentation for this one was a little confusing because it had so many different commands to do the same things etc. This second lab was completed on **April 10th, 2026.**

Additional Lab 3:

Correlation Analysis.

The third lab I did was **correlation analysis.** The documentation for this one wasn't as difficult to read as the previous one. Overall reading the data from the different commands was interesting and to see how the statistical data changes over time periods of **60 minutes, and 24 hours etc.**

This third lab was completed on **April 10th, 2026.**

Additional Lab 4:

Search Under the Hood (elearning with labs).

My fourth additional lab was completed on **April 10th, 2026.** The commands for this lab were a little shorter this time. It was interesting to see the different log data and how it changes based on the small details you write in the different commands.

Final Additional Lab; **Lab #5**:

Multivalue Fields.

This is the final lab I had tried in Splunk. I completed this lab on **April 11th, 2026.** What I found interesting about this lab was seeing the multivalue fields, like when you can see all the lines data **203 lines in XML.** Seeing all the data with the **All Time** restriction was interesting and different from the previous labs. It was in a previous lab but in this one it was half of the focus.

There were different time frame restrictions you had to work with in the lab, but the way it showed all time data was interesting, I had messed around with the data time frame before, for the **All Time** restriction to be a bigger focus in the lab was different but you can see how the data is handled differently. In this lab when working with multivalue fields user stats, there was a user with my name which I found funny, the username was **arangel.**
